# Motivation

**RESOURCE  
EXHAUSTION**

# First public release of a redistributable ME firmware binary

## EDK II non-osi mailing list

*Ignition Firmware is a variant of ME firmware that is intended to provide lightweight chipset initialization. It does not contain all the features of the Intel® Server Platform Services (SPS) ME firmware. Ignition Firmware is consequently much smaller than Intel® SPS Firmware (~0.5 MB vs. ~3 MB).*

# Philosophy

training for FSP by Intel

## Philosophy

### There are ...

- plenty of smart firmware engineers
- comprehensive specifications and standards
- successful implementation examples using various boot loaders.

### There isn't ...

- enough open technical information to program a new silicon

### Therefore ...

- Intel provides what Intel knows the best, and let the ecosystem do what they are the best at

## Vendor perspective

*Intel is working towards releasing as much source code as possible going forward. A binary component is still the best way to encapsulate the complex solution that developers may not necessarily need to bother about as long as the binary component does its job right.*

# Plundervolt

*We build on the reverse engineering efforts of [64, 49, 57] that revealed the existence of an undocumented MSR to adjust operating voltage on Intel Core CPUs. To ensure reproducibility of our findings, we document this concealed interface in detail. All results were experimentally confirmed on our test platforms (cf. Table I).*

**RESOURCE

# Security

Hardware and firmware have to be combined.

PTT is a TPM 2.0 implementation

Security has many dimensions.

- ▶ physical: voltages, hardware accessibility
  - ▶ see Plundervolt
- ▶ computational: constant-time for crypto ops
  - ▶ see TPM Fail
- ▶ logical: programmatic flaws

Auditability is a requirement, fulfilled by open source.

Theorem

*no audit => no trust*

# Obtaining ME firmware images

## ▶ Lenovo

- ▶ download update, e.g.,  
`https://support.lenovo.com/us/de/downloads/ds503998`
- ▶ run `innoextract [file] => app/` directory with files
- ▶ one for consumer and one for corporate version, `Me_xx.x_Coxx.bin` :)

## ▶ HP

- ▶ download update, e.g.,  
`h30318.www3.hp.com/pub/softpaq/sp99501-100000/sp99829.exe`
- ▶ run `7z x [file]` (in a new directory) => many files, we want `Q72_xxxxxx.bin`
- ▶ `xxd Q72_xxxxxx.bin | grep "\$FPT"` (extract line with FPT tag)
- ▶ note down address at beginning without 0 at the end, minus 1
- ▶ `dd if=Q72_xxxxxx.bin bs=16 skip=0x[beginning] count=0x1000 of=me.bin`
- ▶ run `MEA.py` over it: `MEA.py me.bin`
- ▶ check expected length, try higher count for `dd` in case of error
- ▶ correct the count and `dd` again => there we go, `me.bin` :)
